

Problem statement

A real estate agent want help to predict the house price for regions in USA.He gave us the dataset to work on to use Linear Regression model.Create a model that hepls to determine

Data collection

Importing libraries

```
In [2]: import numpy as np
import pandas as pd
import matplotlib.pyplot as plt
import seaborn as sns
```

Importing dataset

```
In [4]: data=pd.read_csv(r"C:\Users\user\Downloads\H.csv")
data
```

Out[4]:

To train the model-Model Building

we are going to train Linear Regression model;we need to split out data into two variables x and y where x is independent variable and y is dependent variable on x (output) we could ignore address column as it is not required for our model

```
In [25]: x=da[['Avg. Area Income', 'Avg. Area House Age', 'Avg. Area Number of Rooms',
            'Avg. Area Number of Bedrooms', 'Area Population']]
        y=da['Price']
```

```
